# H# Official Documentation

The official specification for H#

## Contents

# Abstract

This document is the official document for the H-Sharp (H#) programming language. The H stands for hybrid - as this is a multi-paradigm programming language heavily inspired by C# and Scala. This document will only contain the grammar of the language, the operational semantics as well as the type semantics of the language. The operational semantics may be explained with code samples - but obvious uses will not be explained.

This document will also contain the byte-instruction semantics. The official compiler, is written in C# for productivity purposes while the Virtual Machine is implemented using C++. At no point will this document be documenting the internal processes of those applications.

# Grammar

The offical H# grammar. Note: $Id \in \text{VarEnv}$ and $TypeId \in \text{TypeEnv}$. Both refer to the same grammatical definition, defined by the regular expression:

$$(\_|[\mathtt{a-Z}])^+(\_|[\mathtt{0-9}]|[\mathtt{a-Z}])^*$$

If multiple elements can occur - and it'd be convenient, the element be suffced with 'n' to show it may be contain n of such elements. $n \in \{0, 1, 2, \dots\}$. The notation $e_0, \dots, e_n$ represents the 1 to nth element with a specific separator. The full grammar is defined as follows:

| | | |
|---|---|---|
| *CompileUnit* | ::= | *CompileUnitElement* |
| *CompileUnitElement* | ::= | *CompileUnitElement CompileUnitElement* |
| | \| | *Directive* \| *Scope* \| *ScopeElement* \| *Declaration* |
